

EARTH REMEDIATION PROTOCOL

Sunday, 13 May 2018

BY GLEN HETHERINGTON

Planet earth and therefore her inhabitants have a problem.

The Earth is dying.

1. The planet is warming due to industrialisation creating airborne particulates which are creating artificial clouds which trap in the heat which warms the air which has melted the ice at both the north and south poles.
2. The reduction of the mass of ice at the North Pole has caused the earth's tilt to alter causing a further increase in global temperatures thus exacerbating the warming problem and causing ice to melt at the South Pole.
3. Extensive tree clearing and the explosion in the size of the footprint of modern buildings of concrete have caused heat sinks which re-radiate excessive warmth back into the earth's atmosphere causing more aerobic warming.
4. The mass of the earth is being depleted due to mining causing an alteration in the earth's total mass and its gravity production has altered leading to a reduced orbit around earth's sun which is altering the season's lengths and temperatures.

All of the above are leading to more extreme weather events and already desertification of the landmass in some areas. The root cause is overpopulation of planet earth.

IF WE REDUCE GLOBAL EMISSIONS OF LARGE PARTICULATES THEN THE TEMPERATURE ON EARTH WILL CONTINUE TO RISE DUE TO THE LACK OF PARTICULATES OBSTRUCTING SOLAR RADIATION.

Remedies

1.

Reduce desert areas by plumbing in salt free water and planting masses of trees to reduce radiant heat.

2.

Remove the salt from the water and store in geologically stable areas

3.

Reduce mankind's footprint

4.

Re-ballast the earth by adding mass from the local asteroid belt in order to restore the earth's correct orbit around the sun.
